  8.2 Storage Precautions ..........................................................................................................20
  8.3 Designing Precautions ......................................................................................................21
  8.4 Precautions when disposing of the OEL display modules ................................................21
  8.5 Other Precautions ............................................................................................................21

Warranty .....................................................................................................................................22
Notice ..........................................................................................................................................22
1. Basic Specifications

1.1 Display Specifications

1) Display Mode: Passive Matrix
2) Display Color: Monochrome (White)
3) Drive Duty: 1/16 Duty

1.2 Mechanical Specifications

1) Outline Drawing: According to the annexed outline drawing
2) Number of Pixels: 96 x 16
3) Panel Size: 26.30 x 8.00 x 1.30 (mm)
4) Active Area: 17.26 x 3.18 (mm)
5) Pixel Pitch: 0.18 x 0.20 (mm)
6) Pixel Size: 0.16 x 0.18 (mm)
7) Weight: 0.55 (g)

1.3 Active Area / Memory Mapping & Pixel Construction

![Diagram of display specifications and active area/mapping](image)
## 1.4 Mechanical Drawing

### Notes:
1. Color: White
2. Driver IC: SSD1306
3. Interface: I2C
4. General Tolerance: ±0.30
5. The actual assembled total is without polarizer protective film & remove tape.
6. The total thickness should be 1.65 Max.

### Material
- Panel / E.E.E.
- Soda Lime / Polyimide

### Dimensions
- **Panel Size:** 26.3 ± 0.2
- **Cap Size:** 8 ± 0.2
- **Polarizer:** 7 ± 0.2
- **Contact Side 1:** 6.799 ± 0.1
- **Contact Side 2:** 2 ± 0.3
- **Contact Side 3:** 1.3 ± 0.1
- **Contact Side 4:** 0.1 ± 0.03
- **Contact Side 5:** 10.5 ± 0.3
- **Contact Side 6:** 2 ± 0.3

### Contact Side (Reference Mechanical Design)

### Customer Approval
- Signature: Gary Lin

### Sheet
- 1 of 1
- A3 Size

### Title
- DMX9616SDGF14
- Pixel Number: 96 x 16
- Monochrome, COG Package

### Panel/Module
- QG-90-02WV02 Folding Type E.L. Display Module

### Unit
- **Angle**: ±1
- **Dimension**: ±0.3
- **Roughness**: ±0.5

### Scale
- 1:1

### Date
- 20101109A

### By
- Gary Lin

### Original Drawing
- P.M.

### Sheet Information
- Rev.: B
- Scale: 1:1
- Size: A3
- Material: Panel / E.E.E.

### Design Information
- Title: DMX9616SDGF14
- Date: 20101109A
- By: Gary Lin
- Original Drawing: P.M.

### Notes
- 1. Color: White
- 2. Driver IC: SSD1306
- 3. Interface: I2C
- 4. General Tolerance: ±0.30
- 5. The actual assembled total is without polarizer protective film & remove tape.
- 6. The total thickness should be 1.65 Max.

- **Power Supply**
  - Pin 8 VDD: This is a voltage supply pin. It must be connected to an external source.
  - Pin 7 VSS: This is a ground pin. It also acts as a reference for the logic pins, the OEL driving voltages, and the analog circuits. It must be connected to the external ground.
  - Pin 14 VCC: This is the most positive voltage supply pin of the chip. A stabilization capacitor should be connected between this pin and VSS when the converter is used. It must be connected to an external source when the converter is not used.

- **Driver**
  - Pin 12 IREF: This pin is the segment current reference pin. A resistor should be connected between this pin and VSS. Set the current at 12.5μA maximum.
  - Pin 13 VCOMH: This pin is the input pin for the voltage output high level for COM signals. A capacitor should be connected between this pin and VSS.

- **DC/DC Converter**
  - Pin 5 VDDB: This is the power supply pin for the internal buffer of the DC/DC voltage converter. It must be connected to an external source when the converter is used. It should be connected to VSS when the converter is not used.
  - Pins 3 / 4 C1P / C1N and 1 / 2 C2P / C2N: The charge-pump capacitors are required between the terminals. They must be floated when the converter is not used.

- **Interface**
  - Pin 9 RES#: This pin is reset signal input. When the pin is low, initialization of the chip is executed.
  - Pin 10 SCL: The transmission of information in the I2C bus is following a clock signal. Each transmission of data bit is taken place during a single clock period of this pin.
  - Pin 11 SDA: This pin acts as a communication channel between the transmitter and the receiver.

- **Reserve**
  - Pin 6 N.C.: The N.C. pin between function pins are reserved for compatible and flexible design. It must be floated.
1.6 Block Diagram

</tbody>
</table>

Note 1: All the above voltages are on the basis of “V<sub>SS</sub> = 0V”.
Note 2: When this module is used beyond the above absolute maximum ratings, permanent breakage of the module may occur. Also, for normal operations, it is desirable to use this module under the conditions according to Section 3. “Optics & Electrical Characteristics”. If this module is used beyond these conditions, malfunctioning of the module can occur and the reliability of the module may deteriorate.

Note 3: V<sub>CC</sub> = 7.25V, T<sub>a</sub> = 25°C, 50% Checkerboard.
Software configuration follows Section 4.4 Initialization.
End of lifetime is specified as 50% of initial brightness reached. The average operating lifetime at room temperature is estimated by the accelerated operation at high temperature conditions.
### 3. Optics & Electrical Characteristics

</table>

* \( V_{\text{DD}} - V_{\text{SS}} = 1.65V \) to 3.3V, \( T_{\text{a}} = 25^\circ C \)
4. Functional Specification

4.1 Commands
Refer to the Technical Manual for the SSD1306

4.2 Power down and Power up Sequence
To protect OEL panel and extend the panel life time, the driver IC power up/down routine should include a delay period between high voltage and low voltage power sources during turn on/off. It gives the OEL panel enough time to complete the action of charge and discharge before/after the operation.

4.2.1 Power up Sequence:
1. Power up \( V_{DD} / V_{DDB} \)
2. Send Display off command
3. Initialization
4. Clear Screen
5. Power up \( V_{CC} \)
6. Delay 100ms
   (When \( V_{CC} \) is stable)
7. Send Display on command

4.2.2 Power down Sequence:
1. Send Display off command
2. Power down \( V_{CC} / V_{DDB} \)
3. Delay 100ms
   (When \( V_{CC} / V_{DDB} \) is reach 0 and panel is completely discharges)
4. Power down \( V_{DD} \)

Note 8:
1) Since an ESD protection circuit is connected between \( V_{DD} \) and \( V_{CC} \) inside the driver IC, \( V_{CC} \) becomes lower than \( V_{DD} \) whenever \( V_{DD} \) is ON and \( V_{CC} \) is OFF.
2) \( V_{CC} / V_{DDB} \) should be kept float (disable) when it is OFF.
3) Power Pins (\( V_{DD}, V_{CC}, V_{DDB} \)) can never be pulled to ground under any circumstance.
4) \( V_{DD} \) should not be power down before \( V_{CC} / V_{DDB} \) power down.

4.3 Reset Circuit
When RES# input is low, the chip is initialized with the following status:
1. Display is OFF
2. 128x64 Display Mode
3. Normal segment and display data column and row address mapping (SEG0 mapped to column address 00h and COM0 mapped to row address 00h)
4. Shift register data clear in serial interface
5. Display start line is set at display RAM address 0
6. Column address counter is set at 0
7. Normal scan direction of the COM outputs
8. Contrast control register is set at 7Fh
9. Normal display mode (Equivalent to A4h command)
4.4 Actual Application Example
Command usage and explanation of an actual example

4.4.1 V\textsubscript{CC} Supplied Externally

<Power up Sequence>

Initial Settings Configuration
- Set Display Clock Divide Ratio/Oscillator Frequency 0xD5, 0x80
- Set Display Off 0xAE

V\textsubscript{DD}/V\textsubscript{CC} off State
- Power up V\textsubscript{CC} (RES# as Low State)
- Power Stabilized (Delay Recommended)
- Set RES# as High (3\mu s Delay Minimum)
- Initialized State (Parameters as Default)

Set Multiplex Ratio 0xA8, 0x0F
Set Display Offset 0xD3, 0x00
Set Display Start Line 0x40
Set Charge Pump 0xBD, 0x10
Set Segment Re-Map 0xA1
Set COM Output Scan Direction 0xC8
Set VCOMH Deselect Level 0xDB, 0x20
Set Pre-Charge Period 0xD9, 0xF1
Set Entire Display On/Off 0xA4
Set Normal/Inverse Display 0xA6
Set Contrast Control 0x81, 0xAF

Display Data Sent

If the noise is accidentally occurred at the displaying window during the operation, please reset the display in order to recover the display function.

<Power down Sequence>

Normal Operation
- Set Display Off 0xAE
- Power down V\textsubscript{DD} (100ms Delay Recommended)

V\textsubscript{DD}/V\textsubscript{CC} off State
- Power down V\textsubscript{CC}
<Entering Sleep Mode>

Normal Operation

Set Display Off
0xAE

Sleep Mode

Power down Vcc

<Exiting Sleep Mode>

Sleep Mode

Power up Vcc
(100ms Delay Recommended)

Set Display On
0xAF

Normal Operation

Topwin international corp., limited
4.4.2 $V_{CC}$ Generated by Internal DC/DC Circuit

**<Power up Sequence>**

- **$V_{DD}/V_{DDB}$ off State**
  - Power up $V_{CC}$ (RES# as Low State)
  - Power Stabilized (Delay Recommended)
  - Power up $V_{CC}$ (100ms Delay Recommended)
  - Set RES# as High (3μs Delay Minimum)

- **Initialized State (Parameters as Default)**
  - Set Display Off 0xAE

- **Initial Settings Configuration**
  - Set Display Clock Divide Ratio/Oscillator Frequency 0xD5, 0x80
  - Set Multiplex Ratio 0xA8, 0x0F

* The samples used for the above tests do not include polarizer.
* No moisture condensation is observed during tests.

5.2 Failure Check Standard

After the completion of the described reliability test, the samples were left at room temperature for 2 hrs prior to conducting the failure test at 23±5°C; 55±15% RH.
6. **Outgoing Quality Control Specifications**

6.1 **Environment Required**

Customer’s test & measurement are required to be conducted under the following conditions:
- Temperature: \(23 \pm 5^\circ C\)
- Humidity: \(55 \pm 15\%\) RH
- Fluorescent Lamp: 30W
- Distance between the Panel & Lamp: \(\geq 50\)cm
- Distance between the Panel & Eyes of the Inspector: \(\geq 30\)cm
- Finger glove (or finger cover) must be worn by the inspector.
- Inspection table or jig must be anti-electrostatic.

6.2 **Sampling Plan**

Level II, Normal Inspection, Single Sampling, MIL-STD-105E

6.3 **Criteria & Acceptable Quality Level**

<table>

8. Precautions When Using These OEL Display Modules

8.1 Handling Precautions

1) Since the display panel is being made of glass, do not apply mechanical impacts such as dropping from a high position.
2) If the display panel is broken by some accident and the internal organic substance leaks out, be careful not to inhale nor lick the organic substance.
3) If pressure is applied to the display surface or its neighborhood of the OEL display module, the cell structure may be damaged and be careful not to apply pressure to these sections.
4) The polarizer covering the surface of the OEL display module is soft and easily scratched. Please be careful when handling the OEL display module.
5) When the surface of the polarizer of the OEL display module has soil, clean the surface. It takes advantage of by using following adhesion tape.
   * Scotch Mending Tape No. 810 or an equivalent
   Never try to breathe upon the soiled surface nor wipe the surface using cloth containing solvent such as ethyl alcohol, since the surface of the polarizer will become cloudy.
   Also, pay attention that the following liquid and solvent may spoil the polarizer:
   * Water
   * Ketone
   * Aromatic Solvents
6) Hold OEL display module very carefully when placing OEL display module into the system housing. Do not apply excessive stress or pressure to OEL display module. And, do not over bend the film with electrode pattern layouts. These stresses will influence the display performance. Also, secure sufficient rigidity for the outer cases.
7) Do not apply stress to the driver IC and the surrounding molded sections.
8) Do not disassemble nor modify the OEL display module.
9) Do not apply input signals while the logic power is off.
10) Pay sufficient attention to the working environments when handing OEL display modules to prevent occurrence of element breakage accidents by static electricity.
   * Be sure to make human body grounding when handling OEL display modules.
   * Be sure to ground tools to use or assembly such as soldering irons.
   * To suppress generation of static electricity, avoid carrying out assembly work under dry environments.
   * Protective film is being applied to the surface of the display panel of the OEL display module. Be careful since static electricity may be generated when exfoliating the protective film.
11) Protection film is being applied to the surface of the display panel and removes the protection film before assembling it. At this time, if the OEL display module has been stored for a long period of time, residue adhesive material of the protection film may remain on the surface of the display panel after removed of the film. In such case, remove the residue material by the method introduced in the above Section 5).
12) If electric current is applied when the OEL display module is being dewed or when it is placed under high humidity environments, the electrodes may be corroded and be careful to avoid the above.

8.2 Storage Precautions

1) When storing OEL display modules, put them in static electricity preventive bags avoiding exposure to direct sun light nor to lights of fluorescent lamps. and, also, avoiding high temperature and high...
humidity environment or low temperature (less than 0°C) environments. (We recommend you to store these modules in the packaged state when they were shipped from TOPWIN Semiconductor Inc.) At that time, be careful not to let water drops adhere to the packages or bags nor let dewing occur with them.

2) If electric current is applied when water drops are adhering to the surface of the OEL display module, when the OEL display module is being dewed or when it is placed under high humidity environments, the electrodes may be corroded and be careful about the above.

8.3 Designing Precautions

1) The absolute maximum ratings are the ratings which cannot be exceeded for OEL display module, and if these values are exceeded, panel damage may be happen.
2) To prevent occurrence of malfunctioning by noise, pay attention to satisfy the $V_{IL}$ and $V_{IH}$ specifications and, at the same time, to make the signal line cable as short as possible.
3) We recommend you to install excess current preventive unit (fuses, etc.) to the power circuit ($V_{DD}$). (Recommend value: 0.5A)
4) Pay sufficient attention to avoid occurrence of mutual noise interference with the neighboring devices.
5) As for EMI, take necessary measures on the equipment side basically.
6) When fastening the OEL display module, fasten the external plastic housing section.
7) If power supply to the OEL display module is forcibly shut down by such errors as taking out the main battery while the OEL display panel is in operation, we cannot guarantee the quality of this OEL display module.
8) The electric potential to be connected to the rear face of the IC chip should be as follows: SSD1306 * Connection (contact) to any other potential than the above may lead to rupture of the IC.

8.4 Precautions when disposing of the OEL display modules

1) Request the qualified companies to handle industrial wastes when disposing of the OEL display modules. Or, when burning them, be sure to observe the environmental and hygienic laws and regulations.

8.5 Other Precautions

1) When an OEL display module is operated for a long of time with fixed pattern may remain as an after image or slight contrast deviation may occur. Nonetheless, if the operation is interrupted and left unused for a while, normal state can be restored. Also, there will be no problem in the reliability of the module.
2) To protect OEL display modules from performance drops by static electricity rapture, etc., do not touch the following sections whenever possible while handling the OEL display modules.
   * Pins and electrodes
   * Pattern layouts such as the FPC
3) With this OEL display module, the OEL driver is being exposed. Generally speaking, semiconductor elements change their characteristics when light is radiated according to the principle of the solar battery. Consequently, if this OEL driver is exposed to light, malfunctioning may occur.
   * Design the product and installation method so that the OEL driver may be shielded from light in actual usage.
   * Design the product and installation method so that the OEL driver may be shielded from light during the inspection processes.
4) Although this OEL display module stores the operation state data by the commands and the indication data, when excessive external noise, etc. enters into the module, the internal status may be changed. It therefore is necessary to take appropriate measures to suppress noise generation or to protect from influences of noise on the system design.
5) We recommend you to construct its software to make periodical refreshment of the operation
statuses (re-setting of the commands and re-transfer of the display data) to cope with catastrophic noise.
